QA SAMPLE | DILIGENCE OUTPUTS | SYNTHETIC DATA

A correct citation can hide a wrong number

Jeronimo Munoz Larreta | 9 October 2026 | Independent technical example

Reproduction: a nominally successful output

Reviewed fixture: **FY2025 revenue, USD 1,250.00 thousand**, document synthetic-cim-001, page 4, locator revenue-fy2025. The candidate reports **USD 1.30 million**, status=success, with that same correct citation.

```
Expected base units: 1250000.00
Observed base units: 1300000.00
BLOCK | AMOUNT_MISMATCH | exit 2
```

Positive control and adversarial cases

Input	Required result	Observed
Equivalent units: USD 1.25 million	PASS, exit 0	3 / 3 claims match
Correct citation, USD 1.30 million	BLOCK, exit 2	AMOUNT_MISMATCH
1,250 thousand reported as 1,250 million	BLOCK, exit 2	1000x scale error
Success status, required net-debt fact omitted	BLOCK, exit 2	MISSING_FACT

Release rule

Run the gate on the **exact reference/candidate pair**, retain the report and both SHA-256 hashes, and require exit 0. A passing test suite alone does not approve a new output. Wrong amounts or missing facts require correction and a rerun. This is a proposed rule, not VouchAPI's actual policy.

Run locally: Python standard library only

```
python -m unittest discover -s tests -v
python evidence_check.py fixtures/reference.json fixtures/wrong-number.json
```

The regression suite covers scale, currency, period, metric, missing and duplicate claims, malformed values and CLI errors. Exact Decimal comparisons; no float rounding or silent currency conversion.

Trust boundary

Source facts are mapped and reviewed manually. The checker does not extract documents, verify source authenticity, reconcile free-form text or certify financial statements. This independent example is not a defect report about VouchAPI. No client data, private code, model calls or network services.
